### 1 Fast detection of communication patterns in distributed executions

Thomas Kunz , Michiel F. H. Seuren

**Pr ceedings of the 1997 conference of the Centre for Advanced Studies on Collaborative research** November 1997

Understanding distributed applications is a tedious and difficult task. Visualizations based on process-time diagrams are often used to obtain a better understanding of the execution of the application. The visualization tool we use is Poet, an event tracer developed at the University of Waterloo. However, these diagrams are often very complex and do not provide the user with the desired overview of the application. In our experience, such tools display repeated occurrences of non-trivial commun ...

Katherine Compton , Scott Hauck

**ACM Computing Surveys (CSUR)** June 2002

Volume 34 Issue 2

Due to its potential to greatly accelerate a wide variety of applications, reconfigurable computing has become a subject of a great deal of research. Its key feature is the ability to perform computations in hardware to increase performance, while retaining much of the flexibility of a software solution. In this survey, we explore the hardware aspects of reconfigurable computing machines, from single chip architectures to multi-chip systems, including internal structures and external coupling. W ...

- 1 VLSI circuits: A pipelined clock-delayed domino carry-lookahead adder** 82%

 Bhushan A. Shinkre , James E. Stine  
**Proceedings of the 13th ACM Great Lakes Symposium on VLSI** April 2003  
 Clock-delayed (CD) domino is a dynamic logic family developed to provide both inverting and non-inverting logic on single-rail gates. It is self-timed and can be easily pipelined for superior speed performance which makes it an attractive option in high-speed logic implementation. This paper presents the design of two different high-speed pipeline configurations of a 32-bit carry look-ahead adder using CD domino gates utilizing efficient clocking methodology to reduce the overall critical path delay ...

- 3 Session 7: embedded system techniques (2): Wave pipelining for application-specific networks-on-chips** 77%

 Jiang Xu , Wayne Wolf  
**Proceedings of the international conference on Compilers, architecture, and synthesis for embedded systems** October 2002  
 This paper presents methods for optimizing application-specific networks-on-chips (NoCs). We show that wave pipelining provides more energy efficient data transport than non-wave pipelined communication. We observe 52% energy saving, 60% transistor area saving, and 1.7 times speedup by using wave pipelining in simulation. Wave pipelining is particularly well suited to networks-on-chips because the network structured interconnection provides better delay control. Our analysis shows how designer ...
